Title : Studies of the Hardon-Young Effect in Yeasts
 1. Selection of Suitable Conditions.

Orig Pub : Českosl. mikrobiol., 1956, 1, No 6, 247-254

Abstract : Phosphate esters of sugars are accumulated by yeasts (Hardon-Young effect) through the action of a small dose of leothiocyanates, on whole dried or washed cells of brewer's yeast of bottom fermentation, occurring in tubes with water and sometimes subjected, in this way, to phosphate starvation. -- From the author's summary

Title : Etiology of Interstitial Plasmocellular Pneumonia
 in Nursing Children.

Orig Pub: Českosl. epidemiol., mikrobiol., imunol., 1956, 5,
 No 3, 156-160.

Abstract: In inoculations from lungs of nursing children who died of interstitial plasmocellular pneumonia (IPP) or from other diseases, various species of Candida and Phodotorula were isolated in equal quantities. These facts militate against the supposed identity of these microorganisms with IPP stimulants; however, the authors consider it necessary to conduct

✓ **Microbial sources of diacetyl and acetoin in beer.** A. Kackova-
Krajochovska, A. Vranaček and D. Vojáčková-Novotná
(Brauereiwelt, 1956, 8, 73-83). The reactions involved in the
spoilage of beer. The development of the boney (the name for the con-
version of acetaldehyde under anaerobic fermentation into diacetone
and diacetyl) (acetoin followed by the bony) in diacetone under
aerobic fermentation are discussed. The review also covers the use
of various strains of *Pediococcus*, the preparation of pure cultures and
nutrients involved and collected data on primary and secondary
fermentations of various substances during the breeding process by
Pediococcus and yeast separately and together. The relationship
between the requirements of *Pediococcus* and an iso-*amino* glutamic
and aspartic acid) and the resulting quantities of diacetyl produced
are discussed. (65 references.)

Title : Classification of Wine Yeasts

Orig. Pub. : Preslia, 1957, Vol.29, No.3, 259-277

Abstract : The authors divide the wine yeasts into three groups depending on the shape of the cells: I - circular, II - semioval, III - elongated cells. These groups are distinguished among themselves by their resistance to the content of alcohol in wines and by the end products of their fermentation. Each group of yeasts is characteristic of a definite type of wine. Yeasts isolated from grapes may be assigned both to groups I and II. Group III yeasts have arisen, probably, as the result of selection; they are the most stable in the presence of unfavorable conditions which result when the culture is kept under paraffin. From authors' summary.

"Serological Study of the Genus *Saccharomyces Monacensis Hansen.*"
Bratislava, Biologia, Vol 21, No 4, 1966, pp 252 - 262

Abstract /Authors' English summary modified/: Some strains of *Saccharomyces carlsbergensis* and *S. cerevisiae* do not give a reaction with antisera prepared against other typical *S. strains*. These strains have the same antigen composition as *S. monacensis Hansen*, and show serological relationship with *S. rouxii* Boultroux, *S. cartilaginosus* Lindner, and *S. acidifaciens* (Nickerson) Lodder Kreger-van Rij. By absorption of antisera of these negative strains a specific serum can be obtained, thus permitting them to be distinguished from other strains of the species. The carrier of this serological activity is a surface polysaccharide liberated from the cell membrane during cultivation. It contains a small amount of N, and total hydrolysis yields only mannose. 4 Figures, 3 Tables, 11 Western, 5 Czech, 2 Russian, 2 Japanese references.
Article is in English. (Ms. rec. 18 Nov 65).

Pestiles and diseases of sugar beets in 1947. M. Iwakoshi, Y. Arai, and I. Matsuda /eds./ Ushio, 64, 308-311 (1948). Owing to a warm and dry summer, the pestiles attacked the beets early in the season and disappeared by June. BaCl₂ sprays were effective against Cercosporium, but DDT-Carsenal sprays were not effective; powdered Chaserol was better than eq. sprays but could not compare in effect to BaCl₂. Trials with Cu-AlCl₄ are highly promising. For Halticae Carsenal was effective. Owing to the scarcity of chlorine, a spray of eq. or powdered Chaserol was used effectively against Aphid foliar. The highly resistant Oparosa resistance also resisted all of the above heteropodals (hemicystoids). Although the appearance of Cercosporium seemed suppressed by the sunburn heat, it was controlled by any of the Cu sprays applied when sprays appeared on the leaves. Root knot red was prevented by using fertilizers rich in N or by applying 15-20 kg of humus per ha. of soil. P. Maruyama

Abstract : As a result of wet concentration and other kinds of aqueous processing of coal a considerable portion of the coal is lost in the washings. Laboratory experiments were conducted on clarification of these washings and recovery of coal fines in a hydrocyclone 105 mm in diameter under gauge pressure of 0.5 atmosphere, and then in one of 350 mm in diameter at gauge pressure of 2 atmospheres, with an initial concentration of solid particles of 20 g/liter. Content of solid particles reached 240 g/liter in the concentrate,

Unpublished properties of some substituted 1,3-dihydro-1,2,3,4-tetrahydronaphthalene derivatives
M. L. H. Green and A. M. Miller (J. Org. Chem., 1968, 33, 1361)
In the course of investigation of dehydrogenation reactions with AlCl₃/TiCl₄ it was found that alkyls were readily converted by an excess of Ti to the presence of a small amount of dry H₂O₂. Heating the alkyl in MeOH with a large excess of Ti and a few drops of H₂O₂ in MeOH gave 80-93% yields of mixtures of 1,2-dihydro-1,3-dihydro-1,2,3,4-tetrahydronaphthalene (16-47%), and 1,4-dihydro-1,3-dihydro-1,2,3,4-dihydro-1,2,3,4-tetrahydronaphthalene (13-31%). Similarly, chloroalkyls gave 16-47% of 1,2-dihydro-1,3-dihydro-1,2,3,4-tetrahydronaphthalene and 35-51% of 1,4-dihydro-1,3-dihydro-1,2,3,4-dihydro-1,2,3,4-tetrahydronaphthalene. Heated at 100°C for 1 hr in the presence of TiCl₄ and H₂O₂ alkyls gave no reaction. Reaction with CH₂=CH₂ similarly was unsuccessful. Thus, (PhCH₂)₂ClCl gave 1,2-dihydro-1,3-dihydro-1,2,3,4-tetrahydronaphthalene, and 3,5-diisopropenylbenzene gave 1,2-dihydro-1,3-dihydro-1,2,3,4-tetrahydronaphthalene, in 15-21% yields.

Orig Pub: Roczn. chem., 1957, 31, No 3, 1037-1039.

Abstract: Ethyl ester of nitroncetic acid produces salts with relatively strongly basic amines, during mixing of solutions of equimolar amounts of components in ether and petroleum ether. The following salts of ethyl ester of nitroncetic acid were prepared (the amines and the melting points of salts in °C are given): cyclohexylamine, 113 to 114; iso-propylamine, 100 to 101; benzylamine, 132 to 133;

Acylation of amines with dicyanamides. Stanislaw Moyer,
Marian Koste, and Boleslaw Tarczynski (Wydział Chemiczny
Instytutu Fizyczno-Chemicznego, Polska Akademia Nauk,
Krakow, Poland). *J. Org. Chem.* 23, 277-82 (1958)
(English summary).—By heating primary amines/(1) at
about 120° (7 hrs.) with dicyanamide (3 moles/mole 1) or
with dibenzoylamine (2 moles/mole 1) in toluene or without
solvent, the corresponding *N*-acylamines were obtained.
This reaction is accelerated by acidic catalysts (0.1 mole
 HClO_4). The method of acylation is especially useful when
neutral conditions are required, as well as for the prep. of
primary from secondary 1.

TITLE:

The influence of covering the surface of a carbon with molecules of an inert substance on the potential of a chlorine electrode formed on the powder of this carbon

PERIODICAL:

Przemysl Chemiczny, v. 42, no. 1, 1963, 23-26

TEXT: The present work, which is a continuation of a series of earlier studies with the powder electrode, was aimed at determining the changes in the static potential, consequent upon changes in the energetics of the adsorption of chlorine on the carbon. The potentials were measured at $25 \pm 0.5^\circ\text{C}$, in 0.5 M HCl or 0.5 M HCl, using a powder electrode (prepared from carbon covered with Cl_2CCOOH , chloral, C_2Cl_4 , starch and saccharose) and a solid Ag electrode. Activated carbon Cu was employed for the powder electrode. The highly chlorinated adsorbents led to an increase in the potential, while the carbohydrates reduced it (w.r.t. the value

U204/U307

The influence of covering ...

obtained on untreated carbon). These results were complemented by tests with anthracite powder, which was formed into electrodes before and after purification. Considerably higher potentials were observed on the purified material. It is concluded that adsorption of large molecules on the powdered carbon hinders the adsorption of chlorine, whilst the presence of highly chlorinated compounds on the surface facilitates the adsorption by providing active centers. There are 4 figures.

Title : Glycosides. III. Glycosides of 4-Methylumbelliferone

Orig Pub: Chem. listy, 1958, 52, No 8, 1629-1632

Abstract: A number of new glycosides of 4-methyl-7-oxy-chromone (4-methylumbellifrone) (I) were synthesized. These glycosides, when present in alkaline media, unlike I, can hardly produce any fluorescence, but are suitable for the activity

determination of the glucosidase ferments by a method consisting in the fluorometrical determination of the liberated aglycone of I. The fully acetylated glycosides, β -D-xylose, β -D-glucotose, β -celllobiose and β -maltose are synthesized in accordance with the modified Michael's method cited in literature (see Glaser, E.; Hulwek U.; Biochem. Z., 1924, 145, 514; Helferich, B.; Griebel, R., Liebigs Ann. Chem., 1940, 544, 210). It was not possible to apply the Takahashi method (see Takahashi, R.; J. Pharm. Soc. Japan, 1925, 525, 4) possibly because of the labile chromone I₂₂₀. A mixture containing 0.15 mols

of 4.1 gr III and 4 gr I in 30 ml xylene was heated to 65-80°, followed by the addition of 1.26 gr Mg(CN)₂ and after heating for 1 hour to 80-100° by cooling of the reaction mixture in a moderate vacuum, filtering off the undissolved residue which was then freed of the remaining filtrate, containing xylene washing solutions, by washing with 1n. NaOH, water and evaporation to dryness. IV was obtained from the residue with the yield of 27%, melting point of 168-169° (from alc.), $[\chi]_{D}^{20}$ of +37.2° (with 7.95; chloroform). Tetracetyl- χ - II was, therefore, synthesized

by the Holferich's method (see Holferich, D.; Schmitz-Hillebrucht, E., Dor., 1933, 6, 378). To a suspension of 2 gr pentacetyl- β -D-glucos and 3 gr I in 10 ml of xylene were added at 135° 0.5 gr ZnCl₂, after distilling off xylene the melt was heated for 30 minutes in vacuum, in order to remove any CH₃COOH generated; after the dissolution of the mixture in 25 ml CHCl₃, and removal of the undissolved residues from the filtrate (washed with 1n. NaOH and water) tetraacetyl-(X-II) was separated after the usual evaporation and recrystallization. Its yield was 13%, melting point 173-174° (from alc.), [α]_D²⁰ was + 113.9° (with 3.0; chloroform).
